3D Printing Capabilities

3D Printing at EMS

- At EMS, we are continuing to invest and add value to help our customers grow their businesses.
- We discovered a need to create new prototype parts without having to build expensive dies. In just a few hours, we can now accomplish what would typically take 8-16 weeks.
- Our 3D printer allows us to help our customers make their designed parts more efficiently, giving them the ability to see the prototypes in a matter of just hours or days, saving time and money.
- Having the ability to test critical dimensions and functionality with mating parts immediately is game changing.
- Compatible with AutoCad and Solidworks programs, our 3D printer is capable of printing multiple parts at a time, infused with Fiberglass, Carbon Fiber or Kevlar.
- Here at EMS, we are saving our customers critical time that ultimately translates into tremendous cost savings.
